

Editor's Comment:

The article highlights the management of a complication of breast cancer chemotherapy and follow-up. The authors have stressed that timely detection and management of pericardiac effusion can improve the outcome. The authors have very well concluded that meticulous monitoring in breast cancer survivors, particularly those manifesting unexplained respiratory or cardiovascular symptoms, enables timely and effective interventions that can considerably enhance outcomes and quality of life. A multidisciplinary approach to care is imperative for optimizing management and improving survival rates for patients experiencing neoplastic pericardial effusion.

After considering the reviewers' comments and the revision, the decision on the manuscript for the Asian Journal of Cardiology Research is Accepted.
