<b>Please write a few sentences regarding the importance of this manuscript for the scientific community. A minimum of 3-4 sentences may be required for this part.</b>	This article compares two fundamental graph traversal algorithms, Breadth-First Search (BFS) and Depth-First Search (DFS), highlighting their applications in pathfinding, network optimization, and classification tasks. Through systematic analysis using performance indicators like execution time, memory usage, and path length, the study found DFS to be better for deep searches in memory-constrained environments, while BFS excelled in finding shortest paths and providing comprehensive coverage. Additionally, the paper underscores the potential of hybrid techniques that combine the strengths of both algorithms for improved results in specific scenarios.
