

**Editor's Comment:**

Atrazine's widespread use in agriculture has raised concerns about its toxic effects on human health (mainly on the cardiovascular system) and also on the environment. The findings of this study suggest that exposure to atrazine significantly increases the levels of CK and Trop in albino Wistar rats, indicating cardiotoxicity. This study has revealed the protective effect of honey and green tea against atrazine-induced cardiotoxicity. Further studies are needed to see this effect. The study is important for the health community.

With due consideration to the reviewer's comments and the revision done, the decision on the manuscript for the Asian Journal of Cardiology Research is Accepted.
