

Editor's Comment:

Ischemic cardiomyopathy, though rare in young adults, can lead to severe complications such as left ventricular dysfunction, intracardiac thrombi, and arrhythmias. This case underscores the complexity of ischemic cardiomyopathy in young smokers. Early diagnosis and tailored management strategies are crucial in prevention. A comprehensive, multidisciplinary approach, including early detection, anticoagulation, antiarrhythmic therapy, and heart failure management, is vital for improving outcomes in these patients. The information is important for the health community.

With due consideration to the reviewer's comments and the revision done, the decision on the manuscript for the Asian Journal of Cardiology Research is Accepted.
