The study adds to the expanding body of research emphasizing the need of parental education and structured intervention programs by giving importance to the barriers, attitudes, and factors that influence SRH conversations. Given the prevalence of misinformation, cultural taboos, and low parental engagement in SRH conversations, the findings highlight the significance of evidence-based measures for improving parent-adolescent communication. This study is especially important for policymakers, educators, and healthcare professionals looking to create focused interventions that provide both parents and adolescents with the knowledge and skills they need to make educated decisions.
