

Review Form 3

Journal Name:	International Journal of Medical and Pharmaceutical Case Reports
Manuscript Number:	Ms_IJMPCR_129608
Title of the Manuscript:	A COMPREHENSIVE APPROACH TO GUILLAIN-BARRE SYNDROME: A CASE REPORT
Type of the Article	Case report

PART 1: Comments

	Reviewer's comment	Author's Feedback <i>(Please correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
Please write a few sentences regarding the importance of this manuscript for the scientific community. A minimum of 3-4 sentences may be required for this part.	This manuscript significantly contributes to the scientific community by providing valuable insights into the management and outcomes of Guillain-Barré Syndrome (GBS). It highlights the effectiveness of plasmapheresis and IVIG therapy in improving motor function and overall recovery in GBS patients. This case report also emphasizes the need for early diagnosis and intervention to prevent severe complications, ultimately improving patient outcomes.	
Is the title of the article suitable? (If not please suggest an alternative title)		YES
Is the abstract of the article comprehensive? Do you suggest the addition (or deletion) of some points in this section? Please write your suggestions here.	Included in comment	YES
Is the manuscript scientifically, correct? Please write here.	Yes	YES
Are the references sufficient and recent? If you have suggestions of additional references, please mention them in the review form.	Yes	YES

Review Form 3

Is the language/English quality of the article suitable for scholarly communications?	Manuscript have Grammatical correction, and sentence modification also required.	ENGLISH
<u>Optional/General</u> comments	<p>Abstract-</p> <ul style="list-style-type: none">• The term "Guillain-Barré Syndrome (GBS)" is defined twice, which is unnecessary. It should be defined once and then consistently referred to as GBS.• The aim could be more specific. It currently provides general context about GBS but does not state a clear objective for the case report, such as highlighting a unique aspect of treatment or outcome.• The presentation of the case lacks information on the patient's condition prior to the onset of symptoms and the timeline from symptom onset to diagnosis. This additional context could provide a more comprehensive understanding of the case.• Write only conclusion heading• Phrases like "we discuss" in the discussion and conclusion are redundant, as it is evident that the section is a discussion. The language could be more concise and precise.• The conclusion mentions that the patient is focusing on rehabilitation and long-term care but does not provide any follow-up details or long-term outcomes, which could strengthen the case report.• There are minor grammatical issues and redundancies that could be edited for clarity and readability. <p>Introduction</p> <ul style="list-style-type: none">• Repetition of phrases like "the exact cause is unclear" and "the exact mechanism is not fully understood" could be streamlined for clarity.• The introduction could benefit from a more structured flow. For instance, the paragraphs could be organized into distinct sections: Background, Clinical Presentation, Diagnosis, Treatment, and Future Directions.• The transition between sections could be smoother to enhance readability.• Some sentences are lengthy and could be broken down for better clarity. For example, the sentence describing the role of antibodies and immune activation is quite long and could be divided into shorter sentences.• The sentence "The typical dosage is 0.4 g/kg daily for five days, with similar effectiveness if given over two days" seems out of place and should be integrated more seamlessly with the discussion on treatment.• The introduction occasionally shifts focus abruptly. For instance, the discussion on dosage and treatment outcomes for IVIg could be consolidated with the section discussing standard treatments. <p>Case report</p> <ul style="list-style-type: none">• The treatment regimen, including neuro-supportive medications, antibiotics, plasmapheresis, and IVIG therapy, is well-described. However, the rationale for choosing these treatments could be more explicitly stated to provide a clearer understanding of the clinical decision-making process.• More detailed follow-up information, such as long-term outcomes or any remaining symptoms after discharge.• There are minor grammatical errors and awkward phrasings that could be revised for clarity. For example, the phrase "Nerve conduction velocity which shows the study showed diffuse motor axonal with secondary demyelinating neuropathy LL>UL with preserved sensory in all limbs and ultrasound abdomen and pelvis shows Internal echoes in urinary bladder suggested URE correlation to rule out cystitis" Rephrase this paragraph. <p>Discussion</p> <ul style="list-style-type: none">• Creating clearer subsections or headings could improve the flow and readability.• The discussion includes repeated information about diagnostic methods and clinical manifestations that have already been mentioned in the introduction. Consolidating these points and reducing redundancy would make the discussion more concise.• Phrases like "Guillain-Barré Syndrome (GBS)" are defined multiple times. Define it once and then consistently refer to it as "GBS."• Verify the credibility and relevance of the references cited to support the statements made.	

Review Form 3

	<ul style="list-style-type: none">Discuss any potential challenges or complications the patient might face in the future, and how these can be managed.
