

Review Form 3

Journal Name:	Asian Journal of Case Reports in Surgery
Manuscript Number:	Ms_AJCRS_130081
Title of the Manuscript:	Feasibility and Safety of Concomitant Abdominal Procedures in a Low-Resource Setting: A Surgical Case Report
Type of the Article	Case report

PART 1: Comments

	Reviewer’s comment	Author’s Feedback <i>(Please correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
Please write a few sentences regarding the importance of this manuscript for the scientific community. A minimum of 3-4 sentences may be required for this part.	The manuscript presented is interesting. The topic is important, as the combination of the conditions described in the article is not uncommon, and the treatment of these patients poses a serious challenge for the surgical team. The authors demonstrated an active approach with a favourable result.	
Is the title of the article suitable? (If not please suggest an alternative title)	No. Completely appreciating the authors’ efforts and the result I think for the case report describing the treatment of one patient it is an exaggeration to make a conclusion about safety and feasibility. The authors should present this case as personal experience of dealing with complex surgical pathology by one-stage approach. These findings will add the scientific pool, and the future meta-analysis can make a conclusion about feasibility and safety of this approach.	
Is the abstract of the article comprehensive? Do you suggest the addition (or deletion) of some points in this section? Please write your suggestions here.	Yes	
Is the manuscript scientifically, correct? Please write here.	Yes	
Are the references sufficient and recent? If you have suggestions of additional references, please mention them in the review form.	Yes	
Is the language/English quality of the article suitable for scholarly communications?	Yes	
Optional/General comments	I would ask the authors to provide more details about the procedure performed. In particular, how was the total length of the operation, estimated blood loss, need for blood transfusion intra-operatively, what surgical technique was used (simple on-lay method, double mesh, modified approach)?
