**DIVERSITY OF ANGIOSPERMS AT MACHIGAD FORT, HALASHI, KAHANAPUR,  
BELAGAVI, INDIA**

**ABSTRACT**

The study of phytodiversity of flora within the fort is important. Fortflora found within the historical forts of Karnataka, India are vital for their rich biodiversity, including many rare and endemic species. Machigad is a place where hill with fort, it about 500 to 800 years ago, which built incomplete and this fort environment support a varity of plant species, which are important for ecological, historical and cultural significance. Using the International Union for Conservation of Nature (IUCN) Red list standard, can evaluate the conservation status of species, by finding rich diversity including many endemic and rareplants needs for specific conservation efforts. With this background, this paper attempts to highlight the role played by Machigad fort, Halasi, Khanapur taluk, Belagavi district, Karnataka. The study record 278 species belonging to 69 families, covering 113 herbs, 41 shrubs, 66 trees, 22 climbers, 15 climbing shrubs, 8 undershrubs, 13 lianas species. This fort flora also supports few useful medicinal plants. Therefore, there is an urgent need to protect the fort flora to sustain the biodiversity.

Comment [DNS1]: Revise the abstract according to the changes made to the text.

**KEY WORDS:** Belgavi,Dominant families,Fort flora, Karnataka, IUCN Status,Phytodiversity.

**INTRODUCTION**

The term phytodiversity is the variety of plant species with in a particular region. It also includes different species, genotypes, and habitats, and it plays a crucial role in ecosystem stability. It also functioning as food security, genetic resource, flavours contributing the nutrition and medicinal resources like traditional and modern medicine. Phytodiversity also give ecological, cultural, economic significance. It mainly depends on biotic, abiotic factors. The biotic factors mainly includes species interaction like competition, predation—etc, community composition and abiotic factors like climate regulation, habitat heterogeneity. (Rawat & Khare, 2010). Conservation of phytodiversity involves a combination of strategies and practices aimed to protecting plant species, their genetic variation and ecosystem. (UNBL, 2022).

Flora of Karnataka written by Saldanaha(1984 and 1996) has reported 170 families and 3400 species; Flora of Karnataka Analysis by Sharma *et al.*, (1984) has reported the 3924 species under the 1323 genera these are belonging to 199 families of plant; Flora of Eastern Kamatakawritten by N. P. Singh(1988) reported the 140 families of plant this families contain 1421 species, 696 genera; Flora of Gulberga District by Seetheram *et al.*, (2000) reported the 100 plant families contain 300 genera,

600 species; Flora of Anshi National Park by Laxminarasimhan and Punekar(2011) have reported the 127 plant families and these families contain 923 species, 570 genera; Flora of Gadag District by Kotresha and Kambhar(2016) have reported the 113 plant families and contain 815 species, 518 genera; Flora of Bidar District, karanatak by Seetharam *et al.*, (2018) have reported the 100 plant families and contain 900 species, 300 genera; Flora of Kolar District by Yoganarasimhan *et al.*, (2018) have reported the 118 plant families and contain 854 species, 467 genera; Flora of Karnataka, Vol. 3 by Lakshminarasimhan *et al.*, (2019) have reported 36 plant families and contain 1167 species, 360 genera; Flora of Karnataka A Checklist, Vol. 2: Gymnosperms and Angiospermsby Sanjappa & Sringshwara (2019) have reported the 196 plant families and contain 4853 species, 1543 genera; Studies on Phytodiversity of Mallikarjun hill adi: A Sacred grove in Karnataka, India by Varsha and Sanjay(2023) recorded 160 species, 133 genera and 58 families; Phytodiversity studies in Sri Ramathirth Sacred grove, Halasi, Khanapur taluk, Belagavi district, Karnataka by Yelvattimath and Kotresh (2011) reported 274 species, 215 genus, 80 species; Flowering plants of Chikodi hills Belagavi, Karnataka, India by Dalaviet *et al.*, (2022) recorded 584 species, 383 genus, 95 families.

## MATERIALS AND METHOD

Machigad is small village located between north latitudes 15.3115° and east longitudes 74.7366° according to the Survey of India. It is 41 kms from Belagavi, 16 kms from Khanapur taluk. ~~The place with hill with fort, this fort about 500 to 800 years ago. Halsi, Nandhgad and Ramtheerth etc.~~ are villages surrounded by Machigad (Fig. 01). The geographical area of this area about 2.0284 Sq.Km<sup>2</sup>. ~~To collect the plant specimen for identification and preparation of herbarium. Four seasons will be considered~~ for study, they are pre-monsoon, monsoon, winter and summer. Pre monsoon include April-June showers. Monsoon includes June-September showers. Winter December to Januray. Summer includes February-May. Specimen identification with the following flora (Cooke, 1906; Gamble, 1928; Ramaswamy and Razi, 1973; Saldanha and Nicolson, 1976; Saldanha, 1984 & 1996; Sharma *et al.*, 1984; Singh, 1988; Seetharam *et al.*, 2000; Bhat, 2003; Manjunath *et al.*, 2004; Bhaskar & Kushalappa, 2014; Bhat, 2014; Kotresha and Kambhar, 2016; Seetharam *et al.*, 2018; Yoganarasimhan *et al.* 2018; Sanajappa and Sringshwara, 2019). ~~The specimen will pressed and dried with the help of Rao and Jain method (1976). The dried specimens will be poisoned with alcohol and mercuric chloride mixture (2%) to keep away from fungal attack and insects (Ravindmath and Premnath, 1977). They are submitted to the Herbarium of Karnataka Science College (HKCD) for future references.~~

## RESULTS AND DISCUSSION

A total of 278 species has been collected during the survey from December 2023 to October 2024, ~~which includes winter, summer and pre-monsoon seasons. The species list is arranged alphabetically along with habit, IUCN status, flowering season, common name and nativity. Habit wise analysis shows that herbs are predominate with 113 species followed by trees with 66 species, shrubs with 41 species, climbers with 22 species, undershrubs subshrubs are with 8 species, climbing shrubs with 15 species, and lianas with 13 species(Fig. 02).~~ Out of the 278 species found, the first ten

**Comment [DNS4]:** I didn't understand the importance of this paragraph for the text. It should be contextualized for the audience. Why is this information presented? In addition, the objective of the work was not presented at the end of the introduction.

**Comment [DNS5]:** Collections of plant specimens were made for identification and herbarium preparation. Each specimen was pressed and dried according to the method of Rao and Jain (1976). The dried specimens were previously stored in alcohol mixed with mercuric chloride (2%) to keep them away from fungal and insect attacks (Ravindmath and Premnath, 1977). They were later deposited in the Herbarium of Karnataka Science College (HKCD).

**Comment [DNS6]:** I suggest that the list of species be organized in alphabetical order of families. This will make it easier for other botanists to use this study in the future.

dominant families constitute 154 species. Of these Fabaceae is most dominant family, comprising 34 species, followed by Malvaceae (19), Asteraceae (18), Orchidaceae (17), Apocynaceae (13), Acantaceae (12), Rubiaceae (10), Commelinaceae (09), Poaceae (08), Combretaceae and Lamiaceae 7 species each(Fig. 03).The remaining families are Menispermaceae, Sapindaceae and Loranthaceae represented by 6 species each, followed by Vitaceae, Convolvulaceae, Asparagaceae and Phyllanthaceae represented by 5 species each. Cyperaceae, Dioscoreaceae, Colchicaceae represented by 4 species each. Six families are represented by 3 species each, they are Orobanchaceae, Anacardiaceae, Gentianaceae, Bignoniaceae, Moraceae and Rhamnaceae. Eleven families are represented by 2 species, they are Amaranthaceae, Meliaceae, Oxalidaceae, Salicaceae, Celastraceae, Rutaceae, Cucurbitaceae, Ebenaceae, Verbenaceae, Oleaceae and Santalaceae. There are 31 families represent single species each, Annonaceae, Araceae, Aristolochiaceae, Malpighiaceae, Nyctaginaceae, Solanaceae, Capraceae, Lecythidaceae, Ranunculaceae, Boraginaceae, Hypoxidaceae, Zingiberaceae, Drosaceae, Costaceae, Ulmaceae, Molluginaceae, Balsaminaceae, Crassulaceae, Lythraceae, Linaceae, Onagraceae, Euphorbiaceae, Melastomataceae, Passifloraceae, Apiaceae, Plumbaginaceae, Polygonaceae, Smilaceae, Myrtaceae, Zygophyllaceae and Cannabaceae(Fig.04).

## CONCLUSION

The phytodiversity work reviles about 278 Angiosperms, among them 69 family species have collected from Machigad hill, Halasi, Kanakpur taluk, Belagaum district in the month of December 2023 to October 2024. Out of 278 angiosperms consist about 113 species of herbs, 41 species of shrubs, 66 species of trees, 22 species of climbers, 15 species of climbing shrubs and 8 species are Under subshrubs, 13 liana. In that few are recorded as an endemic species. The forest is moist deciduous to semi evergreen type of forest. It has major diversity of herbs, shrubs and trees respectively;this forest is not disturbed from human interference. The plant diversity indicate the richness of vegetation. This work is helpful for the students, research scholars, educational institutions and forest department. The Machigad forest is need to conserve the endemic plants and fo the future generation. Since the work was under taken for 9-10 months is not sufficient to come to through conclusions, future investigations on this Machigad forest is required.

**Comment [DNS7]:** This is a result and not a conclusion.

**Comment [DNS8]:** This information is not a conclusion.
